

Prioritization Doc

One page. A decision, argued from evidence anyone can re-open. Page two is the same page worked through on a real example.

PART 1 · THE DECISION

one line · write it before you open the data

Not a topic. A choice, with the options named and the slot it has to fit in.

PART 2 · THE METRIC THAT MATTERS

Lesson 5.2 · check the query, not the chart

The metric

and why this one

Where it stands

number + the comparison

The query

event, filter, date range, sample size

If somebody else cannot re-run it from what you wrote here, it is not written down yet.

PART 3 · THE RANKED BACKLOG

Lesson 5.3 · Reach × Impact × Confidence ÷ Effort

ITEM	REACH	IMPACT	CONF	EVIDENCE FOR THAT CONFIDENCE	EFFORT	SCORE

Reach comes from the data. Effort comes from engineering. Impact and Confidence are yours, and a Confidence with no sentence beside it is a wish.

PART 4 · THE RECOMMENDATION

what you are asking the room to do

Sensitivity

which input would flip it

PART 5 · RISKS, AND WHAT COULD MAKE THIS WRONG

Lesson 5.4 · you write these, before somebody else finds them

Correlation

what else is true about them

Sample

how many, could it be random

Definition

what the numbers counted

Who is missing

who is not in this data

PART 6 · HOW WE WILL KNOW IT WORKED

decided now, while you have nothing invested in the answer

The number

and by when

The guardrail

what must not get worse

If it misses

what we do instead

Prioritization Doc worked

The same page, filled in for the team-scheduling tool used throughout Modules 2 to 5.

PART 1 · THE DECISION

worked example

One slot on the Q4 roadmap for self-serve teams. Do we build the reason line on the suggested slot, the calendar-sync reliability fix, or the mobile booking flow?

PART 2 · THE METRIC THAT MATTERS

worked example

The metric	Bookings completed per active self-serve team, per week. It is the one number that moves only when somebody actually finishes the job the product exists for.
Where it stands	1.7, down from 2.4 in the three weeks after the new flow shipped on 3 Aug. Logins rose 8% over the same period, which is why nobody noticed.
The query	Event booking_created (not_active, which is the dashboard default and counts any event at all) · filter plan = self-serve · range 6 Jul – 31 Aug · teams created before 1 Jul · n = 3,100 teams.

The same question on the default definition returns 12,400 and a line that goes up. Both charts are real. One of them answers the question.

PART 3 · THE RANKED BACKLOG

worked example · AI drafted it, the Confidence column is mine

ITEM	REACH	IMPACT	CONF	EVIDENCE FOR THAT CONFIDENCE	EFFORT	SCORE
Reason line on the suggested slot	3,100	2	80%	4 of 6 prototype testers sent unedited; both who did not went hunting for why that slot. Lesson 4.6 session log	1.5	3,307
Calendar-sync reliability fix	1,900	2	100%	412 support tickets this quarter, one cause, reproducible. Zendesk, tag: sync-fail	3	1,267
Mobile booking flow	4,200	1	50%	Biggest reach on the list and no evidence at all. Two execs want it. A hunch, and it is labelled one	6	350
Slack booking notification	2,400	0.5	50%	Asked for in 3 interviews, never with a job attached. M3 research brief, theme 4	2	300
Admin analytics dashboard	300	1	80%	Two enterprise renewals name it. Small reach, real money. Named in both renewal calls	4	60

Note that the item with the largest Reach ranks third. That is the framework working, not failing.

PART 4 · THE RECOMMENDATION

worked example

Build the reason line. 1.5 person-months, shipped inside Q4, and it is the cheapest test of the one thing the drop suggests: people do not trust a slot they cannot explain.

Sensitivity	Drop its Confidence from 80% to 50% and it still ranks first (2,067 against 1,267). But if engineering comes back with Effort 1 on calendar-sync, that takes the top slot at 3,800. The ranking turns on an estimate I have not asked them for yet.
-------------	---

PART 5 · RISKS, AND WHAT COULD MAKE THIS WRONG

worked example

Correlation	The teams who edit the suggested slot may simply be power users who would retain either way. The reason line would then move nothing. Untested.
Sample	"4 of 6" is six people in a prototype session, not sixty in production. It is a signal that pointed me at the right question, not a measurement.
Definition	Every number here counts booking_created. Anyone re-running this on the shared dashboard's default will get a bigger, friendlier number and disagree with me in public.
Who is missing	Teams that churned in the July cohort are not in this data at all. They may have left for exactly this reason, or for one that is not on this list.

I asked the model for the strongest case against building the reason line. Its best one: the drop starts three weeks after launch, not at launch, which fits a seasonal August dip better than it fits a trust problem. I checked last August. There was a dip, about a third the size. So the seasonality is real and it is not the whole story.

PART 6 · HOW WE WILL KNOW IT WORKED

worked example · written before the build

The number	Bookings per active self-serve team back to 2.2 or better within six weeks of ship, same query, same segment.
The guardrail	Median time from open to send does not get worse. If the reason line makes people read instead of send, that is a loss.
If it misses	Below 2.0 at six weeks, we stop, and calendar-sync gets the next slot. Decided now, in writing, while I still have nothing invested in the answer.
